

You are here: bringing new life, and methods,
to stated preference research

Motivation: CBA's of investments in surface water quality fall short, really short

More motivation: \begin{Thought progression}

- Do these investments not actually pay off? (~\$35b per year)
- Or are revealed preference methods failing to capture some benefits?
- Stated preference methods can estimate non-use/non-local benefits.
- Programming is fun.
- Choice experiments are fun.
- Conventional choice experiments don't include enough programming.
- Motivation converged! \begin{study}

Your Grandmother's Choice Card

Question Number 1

	Scenario A	Scenario B	No Change
Fish 	10	20	5
Birds 	125	75	50
Water Quality 	Boatable 	Swimable 	Boatable 
Annual Cost 	\$100	\$75	\$0

- N = 100
- 1 map of study area
- 5-10 total choice cards
- Qualitative attribute levels
- Online sample or paper mail

If Scenarios A and B are the ONLY options besides No Change. Which would you choose?

Our Choice Card

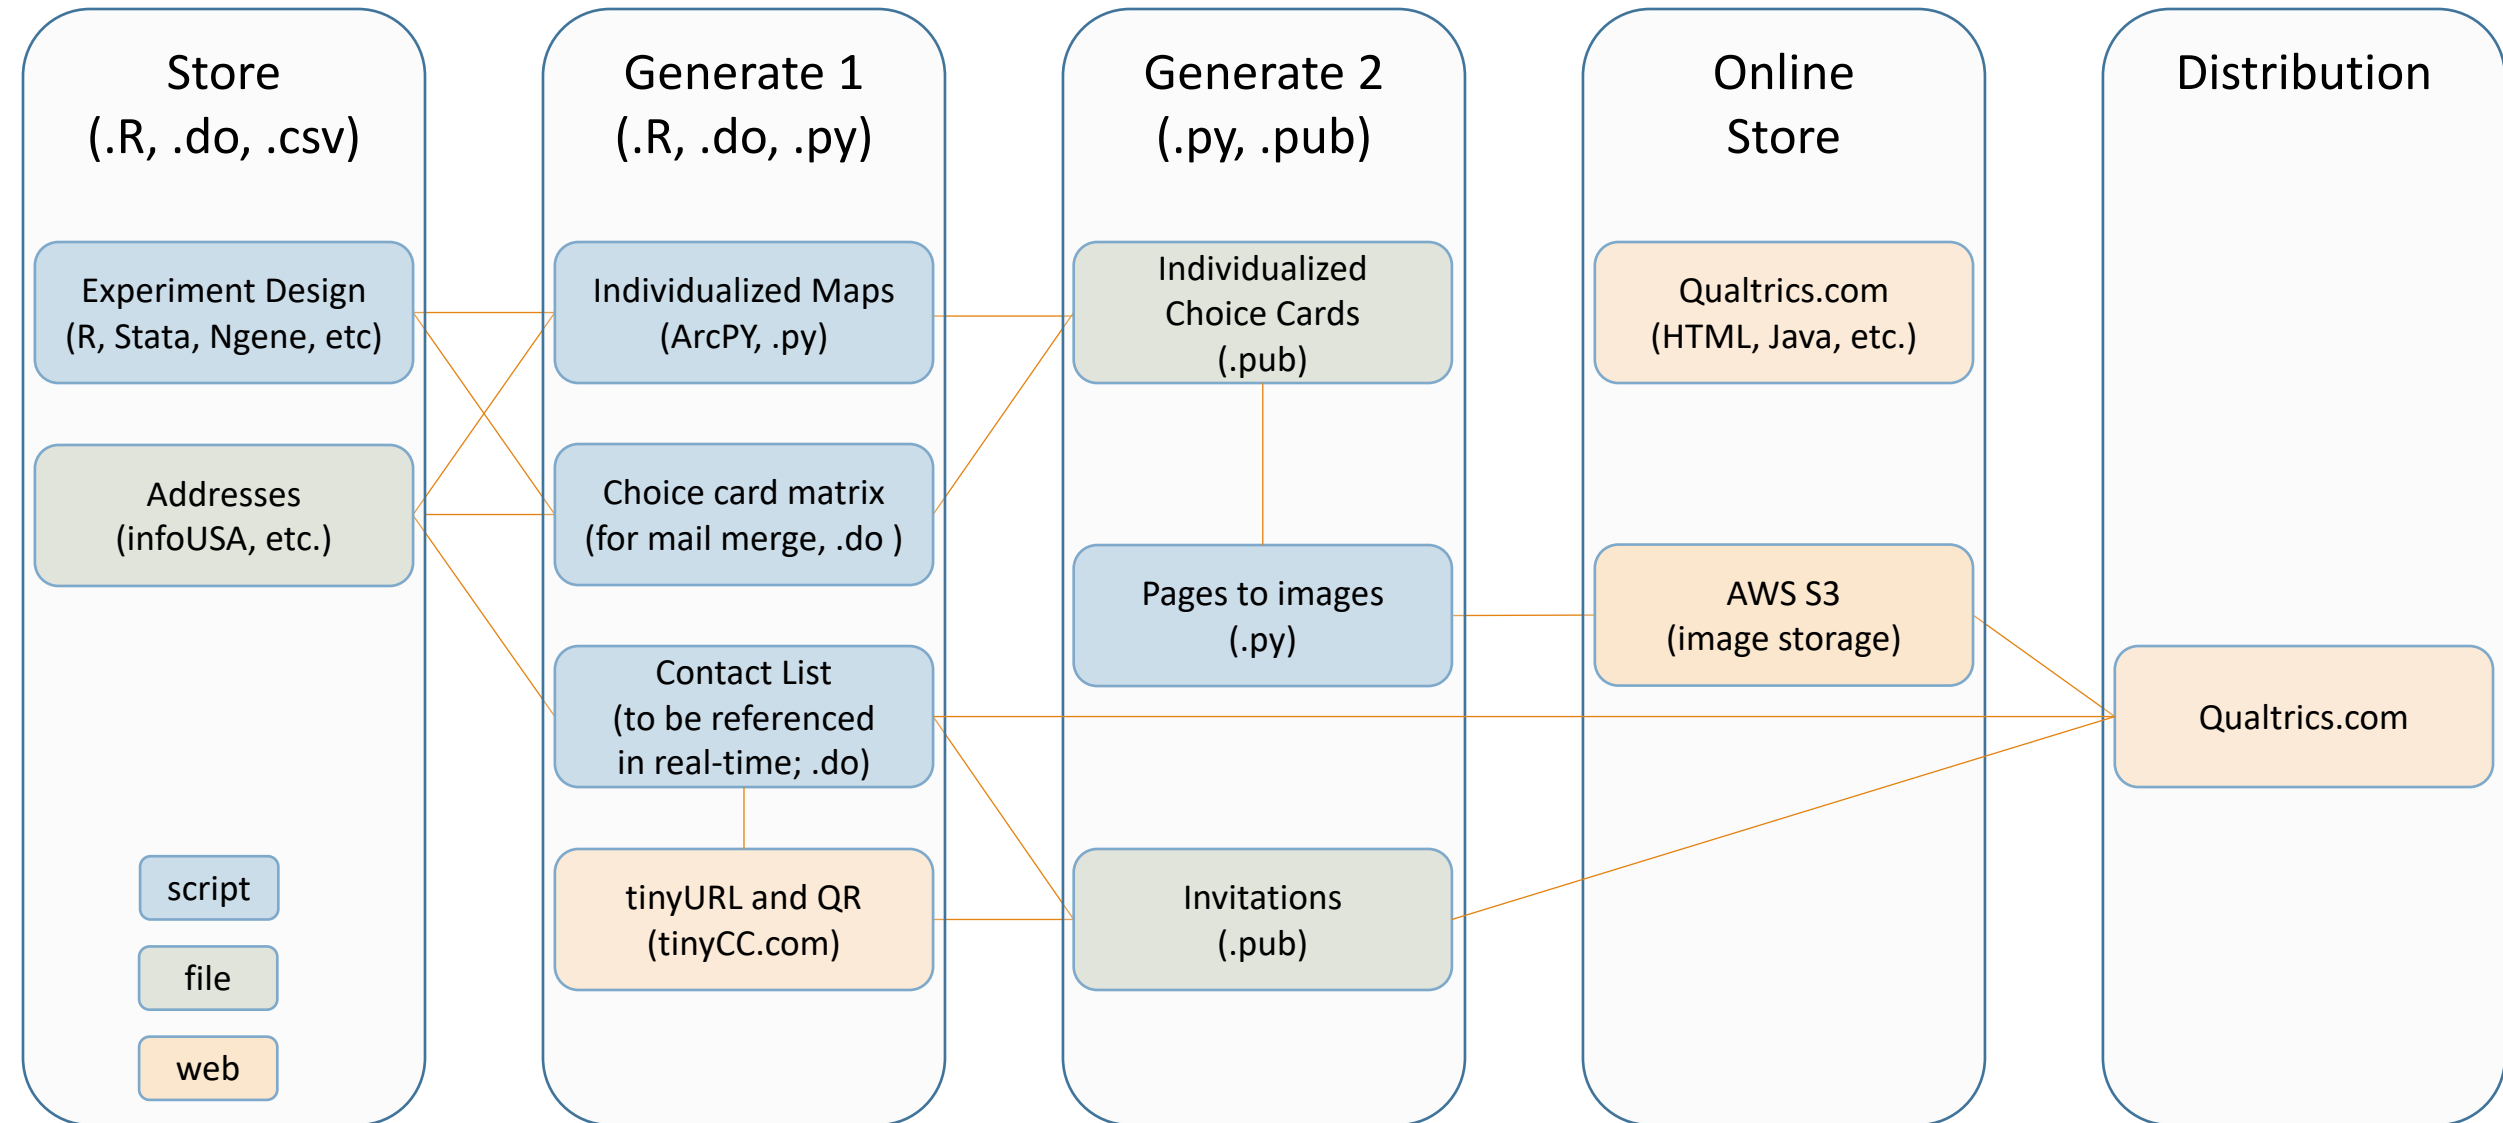

If scenarios A and B were the only options besides No Change, which would you choose?

	Scenario A	Scenario B	No Change
Game Fish Species 	3	2	1
Fish Population 	150	50	30
Algal Blooms Reduced 	50% 	0% 	0% 
Nutrient Target Met 	75% 	100% 	0% 
Distance from Home 	26 miles	4 miles	-
Annual Cost 	\$15	\$60	\$0

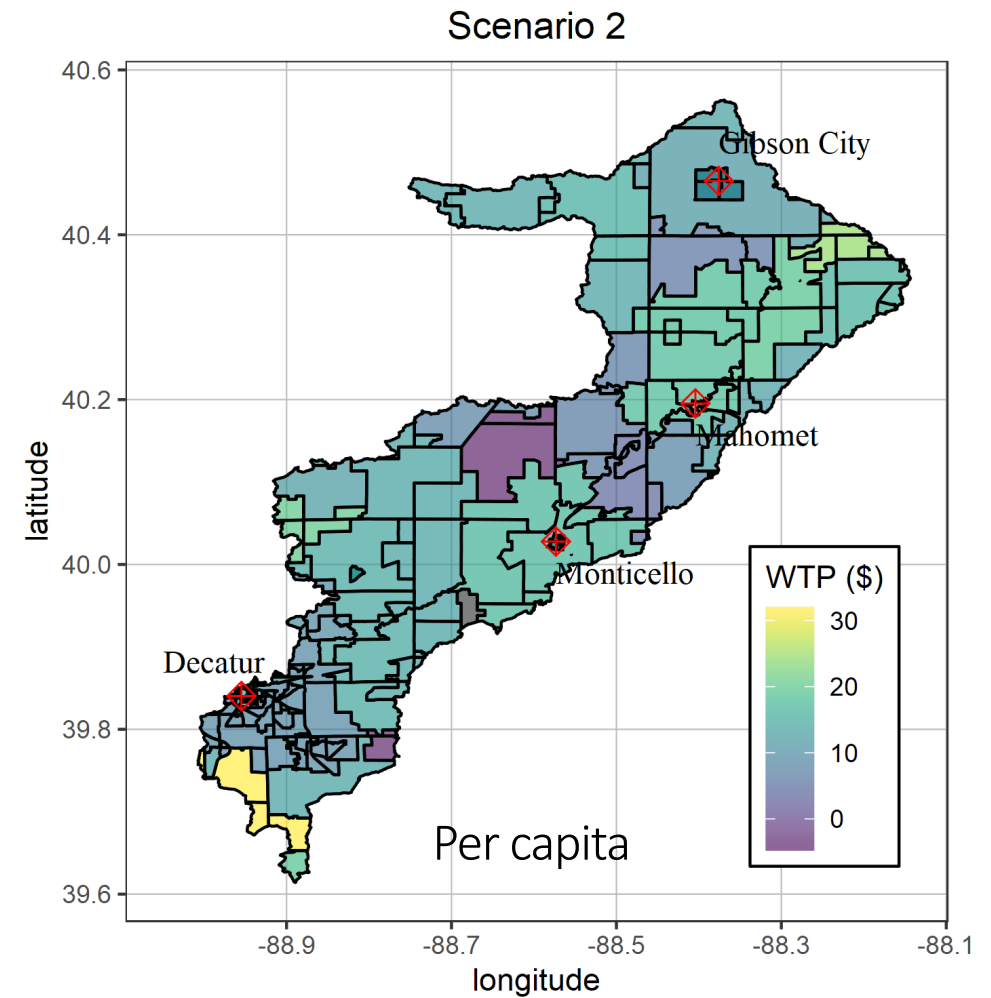

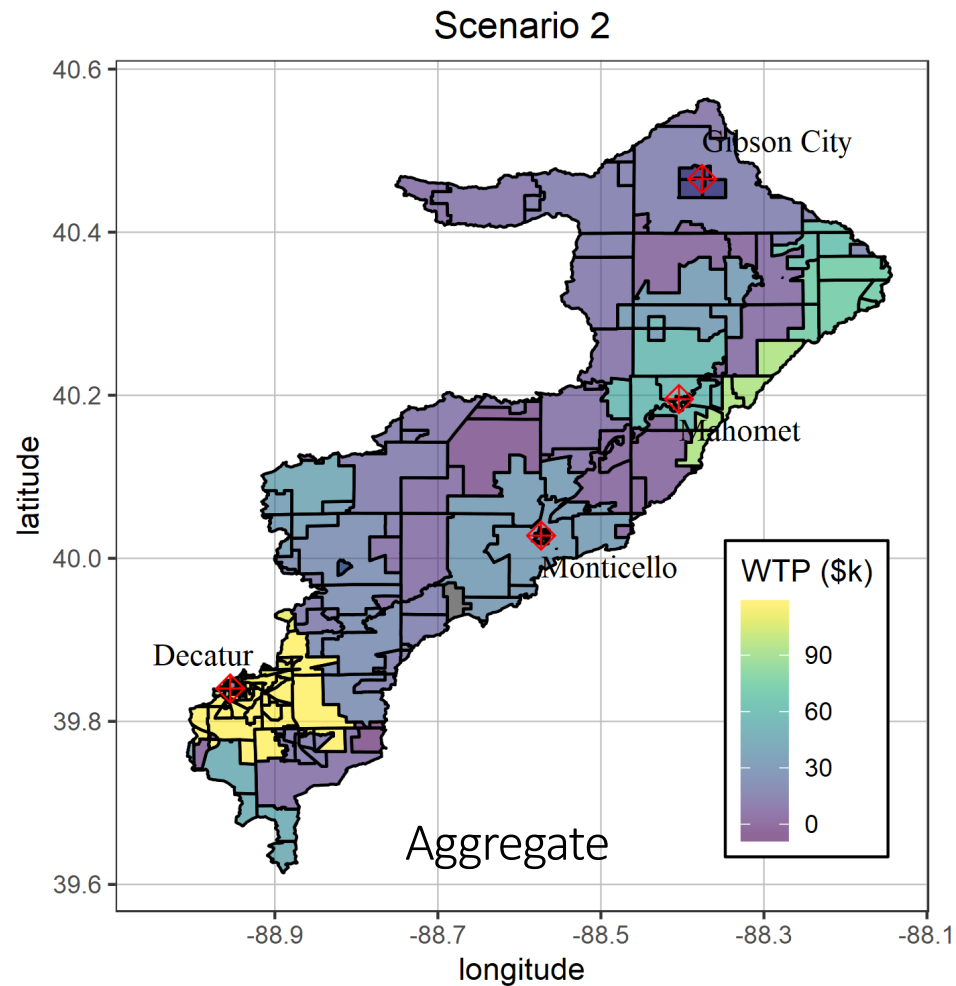

If you are unsure about scenarios A or B, or would not actually spend the money, please choose No Change.

- N = 5,000
- 60k map images
- 30k total choice cards
- Mail-to-online distribution
 - tinyURL and QR
- Cards referenced in real-time

Example Workflow

Application: WTP hotspots and the rural-urban divide (spoiler, rural residents value some improvements more)

Thank you!
